

PROBLEM STATEMENT

Title

AI StudyMentor – An AI-Powered Personalized Learning Guidance System

SDG Alignment

SDG 4 – Quality Education

Problem

Many students and self-learners struggle to choose an effective and structured learning path due to the lack of personalized academic guidance. With the vast number of online courses and learning resources available, learners often feel confused and uncertain about what to study next based on their current skills and career goals. This results in inefficient learning, wasted time, and reduced motivation.

Need

There is a need for an intelligent, accessible, and AI-driven system that can analyze a learner's skill level and objectives to provide personalized and goal-oriented study guidance. Such a solution can improve learning effectiveness, support inclusive education, and help learners make informed academic decisions.

Proposed Solution

AI StudyMentor is a cloud-based AI-powered learning guidance system developed using **LangFlow, IBM watsonx.ai, and Granite Models**. The application collects user inputs such as skill level, learning goals, and preferred subjects, then generates personalized study plans, learning roadmaps, and resource recommendations. The system supports adaptive learning and contributes to **SDG 4: Quality Education** by making quality academic guidance more accessible.

This version aligns better with the technology stack you're claiming (**LangFlow + IBM watsonx.ai + Granite Models**) and is suitable to convert directly into a PDF and upload to GitHub.
